ASCEND ATHLETICS

ADMIN GUIDE

A practical handbook for the owner and assistants.

Prepared: 16 October 2026 | RISE. PUSH. BECOME.

> Everyday work happens inside your website's admin dashboard. You do not need to write SQL or open Supabase to add customers, manage stock or process orders.

Start here

1. Open your ASCEND website and go to **/admin**. If asked to sign in, use your verified account and existing password.
2. Your owner account is **akgreat62@gmail.com**. There is no separate default admin password.
3. For local access, run **npm run dev** in the project terminal, keep it open and visit **http://localhost:3000/admin**. If the terminal's **Local** address uses another port, use that address plus **/admin**. After publishing, use your live website address plus **/admin**.
4. Check for **Connected workspace** at the top, then choose a section from the sidebar.

Find a task

Page	What you want to do
2	Understand the dashboard and its controls
3	Add products, photos and supplements
4	Count opening stock and record restocks
5	Process website, WhatsApp and offline orders
6	Verify payments, refunds and expenses
7	Save and update customer details
8	Set up training packages and coaching
9	Send WhatsApp reminders and prepare email
10	Manage website content and marketing
11	Change business settings and add staff
12	Follow a daily routine and solve common issues

Keep this guide for staff use. Examples explain the controls; always enter the actual amounts and physical counts for your business.

01 / Find your way around

Use the sidebar on a computer. On a phone, open the admin menu first.

Section	Use it for
Overview	Receipts, outstanding balances, orders and active clients
Products	Product details, prices, photos and size/colour variants
Inventory	Opening counts, restocks, reservations and stock history
Orders	Website orders, manual sales, delivery and handover
Customers	Names, phone numbers and linked customer history
Coaching Clients	Enrollments, start dates, renewals and sessions
Training Packages	Physical/online packages, prices and terms
Payments	Transfer claims, actual bank-credit verification and refunds
Finances	Collected receipts, unpaid balances and expenses
Marketing	Consenting subscribers, email campaigns and drops
Website Content	Supported website copy, images and collections
Settings	Bank, pickup, delivery, reminders and staff access

Controls you will use often

- **Row arrow:** click the small diagonal arrow at the far right of a record to open its details and available actions.
- **Save changes:** finishes most forms. If the form asks for confirmation, tick it after reviewing the details. Payment verification uses **Confirm bank credit** instead.
- **Circular arrow:** refreshes the dashboard records. Use it if another staff member has made changes.
- **Search and filters:** narrow the records. **Clear filters** restores the list; the arrows below the table change pages.
- **Download icon:** exports the current page of filtered records as CSV. It is not a complete database backup.
- **View storefront:** opens the customer-facing website so you can check your changes.
- **Account icon:** opens your account page. Choose **Sign out** there when finished on a shared computer.

> When editing an existing record, an action can still be labelled **Add product** or **Add customer**. Open it from that record's details; the form title identifies the edit. Review the selected record before saving.

02 / Add a product

Open: Products. Start a new product as a draft, then prepare its photos and physical stock before making it active.

1. Click **Add product**. Enter **Product name**, **Shop URL slug**, **Category**, **Selling price (NGN)** and **Description**. A slug is the short address, such as **black-training-shorts**: use lowercase letters, numbers and hyphens.
2. Add a useful **Size guide** if needed. The owner may enter **Unit cost (NGN)** for cost reporting. Choose **Draft** for **Product visibility**, then **Save changes**.
3. Open the saved product's row arrow and choose **Upload photograph**. Select the image, write an accurate **Image description**, set **Display order** if needed and save. Use JPEG, PNG or WebP files under 5 MB; order **0** is the first photo.
4. Choose **Add size / colour**. Give each physical size/colour combination a **Unique SKU**, **Size**, **Colour** and **Low-stock alert threshold**, then save. A SKU identifies one exact variation, for example **ASC-SHORT-BLACK-L**.
5. Open **Inventory** and record the physical **Opening** count for every variant. See page 4.
6. Return to the product details and choose **Add product** to open **Edit product**. Set **Product visibility** to **Active**, then **Save changes**.
7. Choose **View storefront** and check the shop, category, photograph, price, sizes and availability.

Visibility	Meaning
Draft	Still being prepared; not a live shop product
Coming Soon	Not currently purchasable
Active	Published; purchases depend on available confirmed stock
Unavailable	Withdrawn from the live catalog

Add supplements in the same way

Choose **Supplements** as the category. Enter the real name, description, selling unit, price and photograph for the item you actually sell. Give each pack size or flavour its own SKU where needed. Use accurate labels for the selling unit; do not assume a clothing size applies. Confirm its real stock before publishing.

Update an existing product

Find it in **Products**, open the row arrow, choose its edit action and change the required fields. To remove a photo, use **Remove photograph** below that image and confirm.

> The four homepage category cards stay fixed. New products and stock update the shop. The existing **Feature on homepage** checkbox does not replace those cards.

03 / Count and manage stock

Open: Inventory. Count the items you physically hold before saving a stock change.

Read the numbers

Column	Meaning
Physical	Unsold units physically held, including reserved units
Reserved	Units temporarily held for existing orders
Available	Physical minus Reserved: units that can be ordered
Sold	Units already recorded as sold by the order workflow
Opening count	Whether the first physical count has been confirmed

Record a count or change

1. Open the SKU's row arrow and choose **Record stock**. Alternatively use the top **Record stock** button and select the correct SKU.
2. Choose **Movement type**. Enter **Count or quantity changed** using the rules below.
3. Explain **Reason / count notes**. Review the SKU and quantity, tick the physical-check confirmation and click **Save changes**.
4. Check the updated Physical, Reserved and Available numbers.

Movement	What to enter	Example
Opening	First TOTAL physical count; once only	You have 3: enter 3
Restock	Number of new units ADDED	You have 3 and receive 5: enter 5; total becomes 8
Reconciliation*	TOTAL physically counted now	Screen says 8; count is 7: enter 7
Adjustment*	Signed correction	Remove one unit: enter -1
Damaged*	Negative number of damaged units	One damaged unit: enter -1
Return	Positive resellable units actually received	One returned unit: enter 1 and confirm inspection

*** Owner action.** Reconciliation and Opening take totals; Restock takes only the addition. For **Damaged**, use a negative quantity even though the current form's helper text only mentions negative adjustments.

Useful habits

- Use **Count needed**, **Low stock** or **Available stock** filters to find the right SKUs.
- Opening count cannot be confirmed twice. Use the appropriate later movement instead.
- A refund does not automatically return stock. Inspect the returned item before recording **Return**, and tick **Returned item inspected and confirmed resellable**.
- Ordinary sales are handled by the order workflow. Do not deduct the same sale again as a stock adjustment.
- If a count conflicts with reservations, review the affected orders. Do not add imaginary stock to get past the warning.

04 / Manage orders

Open: Orders. Website checkouts appear automatically. Use a manual order for WhatsApp, Instagram or in-person sales.

Record a manual sale

1. Click **Record manual order**. Select an existing customer if available, or enter **Customer name**, **Phone number** and optional **Email address**.
2. Choose **Order source** and **Fulfillment method**: **Pickup** or **Delivery**. Delivery requires the recipient, state, city, area and full address. Pickup requires a real pickup location in Settings.
3. In **Order items**, choose **Variant / SKU** and **Quantity**. Use **Add another item** for a different variant. Increase quantity for more of the same SKU.
4. Click **Save changes**. The system uses the current catalog price and checks available stock.
5. In the success panel, use **Copy secure link**, **Open customer view** or **Prepare WhatsApp link**. Keep the secure link while this session's success panel is available. Share it only with that customer.
6. Record and verify the payment through **Payments**. Creating an order does not confirm payment.

Delivery with an unconfirmed fee

Open the order and choose **Quote delivery fee**. Enter the actual fee and save. The customer must approve that quote through their secure order view before the final total becomes payable. A staff quote is not customer approval.

Fulfil the order

After full verified payment, open the order and choose **Update fulfillment**. Select the stage that actually applies, then **Save changes**.

Status	Use it when
Processing	You are preparing the paid order
Ready For Pickup	It is packed and ready for collection
Shipped	You handed it to the courier; add tracking if available
Delivered	Delivery has actually been completed
Picked Up	The customer collected the order

Other actions

- **Add order note:** internal operational notes for staff.
- **Cancel order:** give a reason and confirm. Active reservations are released. A paid cancellation needs owner access. Cancellation does not send a refund or automatically return sold stock.
- **Authorize pay later:** owner-only exception. The unpaid amount remains outstanding.
- **Resolve stock availability:** owner action if payment arrived after a reservation expired and stock is no longer available. Check or restock real items first, then resolve with a note. If the order cannot be supplied, handle cancellation and any actual refund separately.

05 / Payments and finances

A receipt is a claim. Confirm a payment only after checking the actual business bank account.

Record and verify a transfer

1. Open **Payments > Record transfer claim** if the claim is not already listed. Select the **Invoice** and enter the claimed amount, customer reference and transfer date/time. Save it once.
2. Open the claim's row arrow. Use **View proof 1** if evidence was attached. A proof image alone does not show that your bank received the money.
3. The owner checks the actual bank credit, then chooses **Verify bank credit**.
4. Enter **Actual bank credit received (NGN)** and its **Unique bank credit reference**, plus a note if needed. Use the bank's credit identifier, not just the customer's typed reference.
5. Tick the confirmation and click **Confirm bank credit**. Check the invoice balance and order or coaching status afterwards.

> Example only: an invoice totals **NGN 50,000**, but the bank received **NGN 20,000**. Verify 20,000. The remaining balance is 30,000. A later receipt needs a separate claim and its own unique bank-credit reference.

Corrections and refunds

- **Reject transfer claim:** owner explains why an unverified claim cannot be accepted. A rejected submission needs a new claim if the customer tries again.
- Verified payments cannot be silently edited. Do not verify the same bank credit twice; duplicate references are rejected.
- **Record refund:** first send the actual money outside this app. Then select the verified payment, enter **Refund paid (NGN)**, the actual refund bank reference and reason, confirm and save. The app records the refund; it does not transfer money. Handle any returned goods separately in Inventory.

Review Finances - owner

Choose **Today**, **Last 7 days**, **This month** or **Custom range**, then click **Apply**. The reporting timezone normally remains **Africa/Lagos**.

Figure	How to read it
Merchandise / Coaching receipts	Verified collected money
Outstanding balance	Unpaid invoice amounts
Recorded expenses	Costs entered separately from receipts
Recorded refunds	Refunds actually paid and recorded

Choose **Record expense**, enter its real category, amount, date and description, then **Save changes**. Collected receipts are not net profit; product gross profit also depends on recorded unit costs.

06 / Save customer details

Open: Customers or Coaching Clients. Name and phone number are enough for a basic contact record.

Quickly add a customer

1. Search for the person first so you do not add the same contact twice.
2. In **Quick add customer**, enter **Full name** and **Phone number**. Use a reachable number; international format such as **+234...** is useful for WhatsApp.
3. If they have an email, expand **Add email (optional)** and enter it. You can also add it later.
4. Click **Save customer** once and wait for the saved confirmation. The form clears so you can enter the next person.
5. If they are starting coaching, choose **Assign training package** beside that saved confirmation. Their customer record is already selected.

Edit or find a saved contact

Use search, then open the row arrow. Review their contact details and linked orders, coaching, invoices and transfer history. Choose the customer edit action to update the existing record and **Save changes**.

If you see a message that the customer saved but the list could not refresh, refresh or search first. Do not immediately add them again.

Which customers are saved automatically?

Situation	What happens
Customer registers an account	A linked profile/customer record is created; verification is still needed for secure access
Customer completes a successful checkout	Their checkout contact details are saved with the order
Staff records a manual order	The selected or entered customer is linked to the sale
Person only browses the site or opens WhatsApp	Browsing alone does not create a saved customer

Contact record, login and consent are different

- **Quick add customer** creates a contact; it does not create a password or give the person admin access.
- A person who needs a login uses the website's **Create account** flow and verifies their email.
- Saving a customer does not subscribe them to marketing. Newsletter consent is separate.
- Guests can use their secure order link. Do not assume records automatically merge because the name, phone or email looks the same.
- Save only details needed for orders or training. Keep administrative notes brief and avoid unnecessary sensitive information.

07 / Training packages and clients

The usual sequence is **Package > Customer > Pending enrollment > Verified payment > Owner activation**.

Create a package

1. Open **Training Packages > Add training package**. The owner can do this; an assistant needs the specific package-management permission.
2. Enter the actual name, **Training mode** (**Physical** or **Online**), price, description and benefits.
3. Choose **Billing model** and complete the matching terms. Monthly packages use **Calendar months**. Fixed programs use **Fixed program duration (days)**. Session products need the correct **Included sessions**.
4. Tick **Available for enrollment** only when you are ready to accept clients, then **Save changes**. Open an existing package's row arrow to edit it later.

Enroll and activate a client

1. Save or find the customer, then choose **Assign training package**. Select the real package and save. This creates a pending enrollment and invoice; training is not active yet.
2. In **Payments**, record the transfer claim if needed. The owner checks the bank and uses **Verify bank credit > Confirm bank credit**.
3. Return to **Coaching Clients** and open the enrollment. Choose **Activate training**.
4. Enter the **Confirmed start date**, review the payment status, tick the confirmation and **Save changes**. The system calculates the expiry date from the package terms.
5. Confirm the client now shows **Active**, with the correct dates or session balance. Full payment is required unless the owner explicitly authorizes pay later.

Renew a package

Open the enrollment and choose **Renew training**, confirm and save. This creates a new pending enrollment and invoice. Verify its payment and activate it with the correct new start date. The old enrollment remains in the history.

Record sessions and notes

- Use **Record completed session** for one session actually completed on a paid, active session package. Enter its date and save. Session history is permanent.
- Use **Add client note** for a brief administrative note, such as a scheduling update.
- Review remaining sessions and expiry before promising another session. Calendar-month packages follow calendar dates, rather than a fixed assumption of 30 days.

> Assigning a package, verifying a payment and activating training are separate actions. An assistant can prepare the enrollment; the owner confirms the bank credit and activation.

08 / Reminders and messages

Your chosen WhatsApp method prepares a message for you to review and send yourself.

Send a prepared WhatsApp reminder

1. Open **Coaching Clients**, then the client's row arrow.
2. Check the saved phone number and package expiry date.
3. Click **Prepare WhatsApp message**. WhatsApp opens for that recipient with prepared text.
4. Review the recipient, name, renewal date and wording.
5. Press **Send in WhatsApp** when you are ready. The admin dashboard does not send the message automatically.

The same prepared-message control can also appear on customer details. Without a suitable expiry date it may be a general contact message, rather than a dated renewal reminder.

Email reminders need separate setup

As of this guide's preparation, automatic email sending and reminders have not been enabled for customer delivery. A domain and verified sender, provider test and hosted schedule are still needed. The **Enable coaching expiry reminders** checkbox alone does not complete that setup.

When the sending setup is ready:

1. Save each recipient's real email address and confirm their enrollment has the right expiry date.
2. The owner opens **Settings > Edit business settings**.
3. Review **Enable coaching expiry reminders** and **Reminder days before expiry (JSON array)**. The current intended schedule is **[7,2,0]**: seven days before, two days before and on expiry.
4. Keep **Reporting timezone** as **Africa/Lagos** unless the business genuinely uses another timezone.
5. Complete a controlled email test and scheduled-run check before enabling customer delivery.

Email and WhatsApp are separate

Channel	Who finishes sending?	What is needed?
Prepared WhatsApp	You press Send in WhatsApp	Reachable saved phone number; correct message
Automated email reminders	Configured website service	Saved email, qualifying expiry, verified sender and hosted schedule
Signup confirmation email	Account authentication service	Its own working email delivery configuration

Detailed technical setup is in **docs/REMINDERS_SETUP.md** in the project. Ask for setup help rather than pasting private API keys into chat or entering them as customer information.

09 / Website content and marketing

Keep the original homepage layout

The homepage has four fixed category cards: **Compression & tops**, **Shorts & joggers**, **Gym accessories** and **Supplements**. Adding stock or publishing a product updates the shop without replacing these cards. The form's existing **Feature on homepage** checkbox does not control this fixed layout.

Edit supported website content

1. Open **Website Content > Edit website content** or open an existing content row's arrow.
2. Select the correct **Website section**, review its existing values, then update the supported copy or owned image URL.
3. Tick **Publish to website** when the content is ready and **Save changes**.
4. Use **View storefront** to verify the result.

The main **RISE. PUSH. BECOME.** heading and page layout are fixed. Content editing does not make every title or layout editable. Structured FAQ and testimonial content needs valid data; get help with **Additional content (JSON)** if unsure. Publish testimonials only with the customer's approval.

Categories and collections

- **Add category** creates a shop category: enter name, a lowercase hyphenated slug, display order and **Visible category**, then save. A new category does not automatically create another homepage card.
- **Supplements** already exists. Choose it when adding supplement products; do not create a duplicate.
- **Create collection** groups selected real products for a drop. Set its name, slug, description, product selection, launch date/time if needed and visibility (**Draft**, **Upcoming** or **Published**), then save. Check the customer view and scheduled timing.

Newsletter campaigns

1. Add only contacts who explicitly agreed to marketing using **Add consenting subscriber**. Record where consent was obtained.
2. Choose **Draft campaign**, prepare the subject and content and review its recipients. **Preview email** before approval. Get help if you are unsure about HTML content.
3. The owner uses **Approve campaign** after reviewing both content and consent.
4. Once email delivery is configured and tested, the owner chooses **Send approved campaign**. The final button is **Send approved email**.

> Campaign sending contacts real recipients. An order, phone number or coaching registration alone is not newsletter consent. Email campaigns also need the configured sending provider; drafting does not mean delivery is ready.

10 / Settings and extra staff

Update business settings - owner

Open **Settings > Edit business settings**, enter the real details and **Save changes**. Check the storefront or checkout after changing customer-facing information.

Setting	What to enter
Bank details	Actual bank name, account number, account holder and transfer instructions
Pickup	Real location, contact number, hours and collection instructions
WhatsApp number	International digits only: 2349130607719; no + or spaces in this settings field
Contact / Instagram	Actual business email and social address
Reporting timezone	Africa/Lagos for this business
Stock reservation duration	Intended holding time in minutes; minimum 15
Reminders	Intended schedule; email setup is still required

For supported locations, use **Add delivery rate** and enter the real state, optional city/area, fee and active setting. An assistant needs the separate delivery-rate permission. Other destinations follow the quote-and-customer-approval process.

Add another staff member

1. Have the person create their own website account and verify their email.
2. As owner, open **Settings > Manage staff access**.
3. Choose the person under **Existing user** and select **Assistant** or **Owner**. Check the identity carefully.
4. For an assistant, enable **May manage training packages** and/or **May manage delivery rates** only if you want those permissions.
5. Tick the access confirmation and **Save changes**. Ask them to sign in with their own account and open **/admin**.

Role	Main access
Assistant	Catalog, ordinary stock work, orders, contacts, pending enrollments, renewals, sessions and drafts; package/rate management only when granted
Owner	All assistant work, plus bank verification, refunds, activation, pay-later exceptions, stock-conflict resolution, finances, settings, staff and campaign approval/sending

Owner-only stock corrections include **Adjustment**, **Damaged** and **Reconciliation**. Some controls are disabled for assistants by design.

Change or remove access later

Use **Staff access** in Settings to edit a role or choose **Revoke staff access**. Give a reason and confirm. Customer records and history remain. The last owner cannot be removed. To transfer control, add and verify the new owner's access before removing the old owner's role. Each person should use their own password.

11 / Daily routine and quick fixes

A simple daily checklist

1. Open **Overview**: review unpaid balances, orders needing attention and active clients.
2. Open **Payments**: compare pending claims with the business bank account. Verify only money actually received.
3. Open **Orders**: prepare paid orders, confirm delivery quotes were accepted, and update real handovers.
4. Open **Inventory**: check low-stock items and new deliveries. Use **Restock** only for units physically added.
5. Open **Coaching Clients**: check upcoming expiry dates, send appropriate WhatsApp reminders and record completed sessions.
6. Check **Finances**, enter actual expenses and sign out when finished on a shared device.

If something looks wrong

Problem	First checks
/admin returns to sign-in	Sign in with the correct verified staff account; a customer login alone has no admin role
Setup required / cannot load records	Refresh once and read the error; ask for connection help before retrying a payment or stock write
Product missing from shop	Check Active status, its photos/price and confirmed opening counts for every variant
Product shows sold out	Check Available stock and reservations; restock only real delivered units
Customer saved but not visible	Search and refresh; a successful save may only have missed the list refresh
Cannot verify payment	Owner access is required; the final delivery fee must be accepted; check unique bank credit reference
Cannot activate training	Check verified full payment or owner exception, selected enrollment and confirmed start date
Reminder email did not arrive	Check saved email, expiry and provider/scheduler setup; enabling a checkbox is not enough
A button is disabled	Check role/permission, setup state, required fields and any confirmation checkbox
Totals look incomplete	Clear filters, review the date range, click Apply and check other pages

Keep useful records

Share a private order link only with its customer. Review stock and payment history instead of deleting or repeating completed entries. CSV export covers only the displayed page and is not a full backup. Keep passwords and server/API credentials private.

Project reference files

- **docs/OWNER_SETUP.md** - existing owner access and later staff changes.
- **docs/CUSTOMER_DETAILS.md** - quick contact entry.
- **docs/REMINDERS_SETUP.md** - email and WhatsApp setup.
- **docs/SUPABASE_BEGINNER_GUIDE.md** - optional database orientation.
